

Vitra utilise le plus souvent de l'aluminium et de l'acier pour les composants métalliques. Étant donné que la production d'aluminium recyclé nécessite 94 % d'énergie en moins que l'aluminium de première fusion, Vitra utilise autant que possible de l'aluminium constitué à 95 %

de matériau recyclé. Selon le produit, les surfaces métalliques sont revêtues par poudre, chromées, polies, galvanisées ou laquées. Un revêtement en poudre lisse ou structuré offre une protection des surfaces et des couleurs.
